<u>Last time</u>: Basic notations + terminology.

Linear Systems of Equations

Defn: Let x,, x2, ..., xn be variable symbols (or variables).

A linear combination of these variables is any sum of form $a_1 \times_1 + a_2 \times_2 + \cdots + a_n \times_n$

where a, a, a, ..., an are constants (i.e. Gefficients).

NB: Constants are real numbers.

A linear equation is an equation $a_1 \times_1 + a_2 \times_2 + \cdots + a_n \times_n = b$ where a_i 's and b are all constants. A linear system

of equations (or linear system) is a collection of linear equations.

 $\begin{cases} a_{1} \times_{1} + a_{12} \times_{2} + \cdots + a_{1m} \times_{n} = b, \\ a_{2,1} \times_{1} + a_{2,2} \times_{2} + \cdots + a_{2,n} \times_{n} = b_{2} \\ a_{m,1} \times_{1} + a_{m,2} \times_{2} + \cdots + a_{m,n} \times_{n} = b_{m} \end{cases}$

NB: This is an mxn system, or a system with m equations in n nuknowns.

Non Ex: The system $\begin{cases} x^2 + \sqrt{2} = 4 \\ -y + x = 3 \end{cases}$ is not linear

Defn: A solution to an mxn linear system is an n-type (or vector) of constants satisfying all equations simultaneously

God: Given a linear system, compute all solutions $E \times Solve \begin{cases} x - y + 22 = 0 \\ 3x + 42 = 4 \end{cases}$ y - 22 = 2

Sol: Is (x,y, 2) is a solution to this system:

$$\begin{cases} x - y + 2z = 0 \\ 3x + 4z = 4 \end{cases} \xrightarrow{E_{9}3 + E_{9}} \xrightarrow{E_{1}} \begin{cases} x = 2 \\ 3x + 4z = 4 \end{cases}$$

$$y - 2z = 2$$

$$y - 2z = 2$$

$$\begin{array}{c}
E2 - 3EI \longrightarrow E2 \\
\uparrow \uparrow \uparrow
\end{array}$$

$$\begin{cases}
X = 2 \\
4z = -2
\end{array}$$

$$\begin{cases}
Y - 2z = 2
\end{array}$$

$$\begin{cases}
Y - 2z = 2
\end{array}$$

$$\begin{cases}
Y - 2z = 2
\end{array}$$

$$\frac{E3 + 2E2 \longrightarrow E3}{\uparrow} \begin{cases} \times = 2 \\ 2 = -\frac{1}{2} \\ y = 1 \end{cases}$$

:. The system has solution
$$\begin{bmatrix} 2\\ -\frac{1}{2} \end{bmatrix} = \begin{bmatrix} x\\ y\\ z \end{bmatrix}$$
.

NB: The above method is Gaussian elimination.
This method almos solves a linear system.

IDEA: Systematic elimination of variables ...

NB: Every linear system can be solved using the Kollowing three operations:

- O Swap too sows
- @ Multiply a row by a nonzero constant.
- These are the elementary (ion) operations.

$$\begin{cases} 2x - 2y + 2 = 0 \\ 4y + 2 = 20 \\ x + 2 = 5 \\ x + y - 2 = 10 \end{cases}$$

because it has more equations than variables.

$$\begin{cases} 2x - 2y + 2 = 0 & E | \triangle E \\ 4y + 2 = 20 \\ x + y - 2 = 10 \end{cases} \begin{cases} x + 2 = 5 \\ 4y + 2 = 20 \\ 2x - 2y + 2 = 0 \\ x + y - 2 = 10 \end{cases}$$

$$\begin{array}{c}
E3-2EI\rightarrow E) \\
+2=5 \\
+y+2=5 \\
-2y-2=5 \\
-2y-2=5
\end{array}$$

$$\begin{array}{c}
+2=5 \\
-2y-2=5 \\
+2y+2=10 \\
+y+2=20
\end{array}$$

Ex: Solve
$$\begin{cases} x - y + z = 2 \\ x + y - z = -1 \\ 3x + y - z = 1 \end{cases}$$

$$\begin{cases} x - y + z = 2 & E2 - E1 \rightarrow E2 \\ x + y - z = -1 & \hline{E3 - 3E1 \rightarrow E3} \end{cases} \begin{cases} x - y + z = 2 \\ 2y - 2z = -3 \\ 4y - 4z = -5 \end{cases}$$

E3-2E2AE3

$$X - y + z = 2$$
 $2y - 2z = -3$
 $0 = 1$

Contradiction.

 $1 = 1$

Plance this system has no solutions.

I.e. its solven has no solutions.

Ex: Solve the system

 $1 = 1$
 $1 = 1$
 $1 = 1$
 $1 = 1$
 $1 = 1$
